

NEWS RELEASE

ROXMARK REPORTS HARDROCK PROJECT DRILLING CONTINUES TO INTERSECT HIGH GRADE GOLD

Toronto, Ontario, March 31, 2009. Roxmark Mines Limited (TSXV–RMK) today reported on the progress of the drilling program being carried out on the **Hardrock Project joint venture with Premier Gold** in Geraldton, Northwestern Ontario. Drilling by Premier as operator continues to intersect high grade open pit-style mineralization in the EP-Zone target. **Intersections that include 4.56 grams per tonne gold (g/t Au) across 24.5 metres (m) in hole EP029, 3.04g/t Au across 31.3m in hole EP031, and 2.63g/t Au across 43.5m in hole EP032 suggest strong tonnage potential as drilling progresses into the heart of the EP-Zone. These intersections are located 50 m and 100 m west of a previously announced intersection of 2.37g/t Au across 62.7m in hole EP026.** This drilling continues to identify significant near-surface (open pit-style) mineralization contained within multiple zones and further supports the operator’s belief that high grade potential exists proximal to mine workings. Recent highlights include:

- **EP-Zone mineralization has been intersected over a minimum strike length of 400 metres and remains open in all directions.**
- **The above mentioned intersections are contained within the north limb of the EP-Zone. Drilling is ongoing in the South Limb (assays pending) along strike from a previously announced intersection of 11.83 g/t Au across 11.4 m.**

EP-ZONE

The EP-Zone is comprised of near-surface mineralization proximal to the historic North Zone mine workings from which nearly one million ounces of gold was produced to a depth of 2,000 feet. Drilling has identified multiple sub-zones within the iron formation-hosted South (SL) and North (NL) Limbs of the EP target. Significant mineralization has been intersected over a strike length of 400 metres, to depths of up to 150 metres and remains open in all directions.

The following table of the results demonstrates continuity and grade within the EP-Zone, supporting the operator’s belief that historic and new results will be utilized in a NI43-101 compliant resource calculation which is expected to be completed in Q4 2009.

HOLE-ID	ZONE	FROM (m)	TO (m)	INTERVAL (m)	GRADE (g/tonne)	INTERVAL (ft)	GRADE (oz/t)
EP026**	NL	79.0	141.7	62.7	2.37	205.7	0.07

* True widths estimated at approximately 70% of intersection width ** previously announced intersection

The current program at **Hardrock Project** is expected to consist of more than 50,000 metres of definition and exploration drilling. The Project is operated by Premier Gold Mines Limited (TSX-PG) under a joint venture in which Premier is earning a 70% interest and Roxmark has a 30% carried interest. The **Hardrock Project** is host to several past-producing mines which collectively produced more than 2.0 million ounces of gold from the same deposits to shallow depths of some 2000 feet (600 metres) from 1938-1968. The mined zones remained open at depth at the time mining ceased and developed historical resources were left in place within the existing mine workings. *(A qualified person has not done sufficient work to verify the historical resource, the Company is not treating the historical resource as a current resource and the historical resource should not be relied upon).*

Importantly, the Hardrock Project has the potential for defining several styles of mineralization capable of hosting resources, with grades and widths similar to many of Ontario's major gold mines including:

- 1) Open pit-style mineralization with grades exceeding 1.5 g/t Au (Timmins, Hemlo)
- 2) Broad zones of mineralization with grades averaging 5.0+ g/t Au (Musselwhite)
- 3) Narrow vein zones with higher gold grades often exceeding 7.0g/t (Red Lake, Pickle Lake).

Initial drilling is focusing on delineating both open pit and underground resources with the goal of defining a multi-million ounce gold resource that can be moved quickly towards development (*see references to historical resources above.*). The Project offers development advantages with the Trans-Canada Highway, TransCanada Pipeline, and major power lines running through or located proximal to the property. Significant potential exists for developing resources in several areas including: open pit-style mineralization at the site of the original discovery where a resource containing several hundred thousand ounces of gold was partially drilled off by previous operators; several newer high-grade discoveries that have been made throughout this large property package that have received little to no follow-up; resource blocks reported to remain within the mine workings; and the main mined zones which remain open below the 600 m level.

Stephen McGibbon, P. Geo., is the Qualified Person for the information contained in this news release and is a Qualified Person within the meaning of National Instrument 43-101. The assay results are from core samples sent to Activation Laboratories, an accredited mineral analysis laboratory in Thunder Bay, Ontario, for preparation and analysis utilizing both fire assay and screen metallic methods.

The **Hardrock Project** is located in the heart of the Beardmore-Geraldton Greenstone Belt, a highly prospective high-grade gold district that has seen relatively little exploration over the past several decades.

About Roxmark Mines

Roxmark Mines Limited is the leader in gold and molybdenum exploration and development in the historically significant Geraldton-Beardmore area of Northwest Ontario. In addition to the Hardrock Project in the Geraldton Camp, Roxmark is aggressively pursuing a number of initiatives in the Beardmore Camp, including re-opening the Northern Empire Mine utilizing the upgraded onsite mill. In recent years, Roxmark has generated cash flow from bulk-sampled gold and molybdenum processed at its fully-permitted mill and has the advantage of infrastructure from nine formerly highly productive gold mines located on its properties. These mines previously produced nearly four million ounces of gold from high grade ore but were closed primarily due to dramatically lower gold prices at the time and to boundary issues, since eliminated.
